HUMAN-CENTRIC  
GOVERNANCE

# Summary

- Overview of drone technologies
- Drone applications and dual use
- Overview of drone market
- Where the EU stands with drone regulation
- Outlook on future 'drone society'

# Why drones matter

## AI IN PHYSICAL SPACE

---

- Real-time sensing
- Autonomous decision-making

## CONVERGENCE OF TECHNOLOGIES

---

- AI
- 5G / 6G
- Edge / Cloud
- IoT
- Robotics

## CRITICAL INFRASTRUCTURE

---

- Logistics
- Emergency response
- Humanitarian aid
- Agriculture
- Energy
- Security
- Defense
- Health
- ...

## SOCIETAL TRANSFORMATION

---

- Privacy
- Governance
- Human agency
- New dependencies

Drones are among the first large-scale cyber-physical systems operating directly in public space

# Anatomy of drones: key components and functions

## 1. PROPELLERS

Generate lift and thrust. Optimized shape for efficiency and stability.

## 2. MOTORS (BLDC)

Brushless DC motors provide power and precise control of rotation.

## 3. ESC (ELECTRONIC SPEED CONTROLLER)

Regulates the speed and direction of each motor.

## 4. GPS / GNSS RECEIVER

Provides position, velocity and time information for navigation and stability.

## 5. FLIGHT CONTROLLER

The "brain" of the drone. Processes sensor data and runs control algorithms to stabilize and navigate.

## 6. BATTERY

Provides electrical energy to all systems. Capacity (mAh) determines flight time.

## 7. COMMUNICATION MODULE

Handles RC link, telemetry and data transmission (e.g., 2.4/5.8 GHz, 4G/5G).

## 8. ANTENNAS

Ensure reliable communication and GNSS reception.

## 9. OBSTACLE AVOIDANCE SENSORS

Cameras, LiDAR, or ultrasonic sensors detect obstacles and enable safe navigation.

## 10. PAYLOAD / CAMERA

Camera or other payload (e.g., thermal, multispectral, LiDAR) for data capture and mission-specific tasks.

## 11. GIMBAL (3-AXIS STABILIZATION)

Stabilizes the camera on pitch, roll and yaw axes for smooth footage.

## 12. LANDING GEAR

Provides stable takeoff and landing and protects the payload.

## ADDITIONAL COMPONENTS

Power Distribution Board (PDB)  
Distributes power safely to all components.

LED Status Indicators  
Show system status and flight mode.

Frame / Body  
Provides structural integrity and protects components.

# Autonomous system architecture — on-board stack & off-board ecosystem

## On-board

## Off-board

Drone (air)

Robot (ground)

Autonomous car (land)

### 5 DATA

Real-time environment mapping, situational awareness & decision-making

- 3D mapping — airspace / road environment
- Object detection & tracking
- Route/path planning
- Decision — navigate, avoid, yield, turn

### 4 CONTROL

Autonomous behaviour & vehicle/flight control

- Flight / driving control algorithms
- Trajectory & path tracking
- Stability / speed & steering control
- Autonomous mission / behaviour planning

### 3 COMPUTE

Onboard AI processing & edge computing

- Onboard flight / vehicle computer
- Sensor fusion & state estimation / localisation
- AI inference — object detection & tracking
- Edge processing for low latency

### 2 CONNECTIVITY

Data, commands & coordination

- 5G / LTE · Satellite (backup)
- U-space / UTM (drones) · V2X (cars)
- Remote ID & command link
- Cloud & traffic systems

### 1 HARDWARE

Physical platform, sensors & actuation

- Cameras · LiDAR · Radar · IMU / GNSS
- Batteries & power management
- Frame / chassis & drive system
- Actuators — motors, rotors, steering, brake

..... CAMERAS LIDAR IMU/GNSS ROTOR SYSTEM RADAR WHEELS / DRIVE .....

### Satellites

GNSS · Earth observation · connectivity backup

### Edge nodes

MEC servers · roadside units · U-space

### 5G / 6G network

Base stations · antennas · private 5G

### Cloud infrastructure

Orchestration · data lakes · digital twins

### AI Factories / Giga-factories

Model training · simulation · fleet/swarm learning

# Drone Swarm: many drones, one intelligence

### HOW A SWARM WORKS

- 1. PERCEIVE**  
 Each drone senses its environment and the other drones.
- 2. COMMUNICATE**  
 Drones share information locally with nearby neighbors.
- 3. DECIDE**  
 Each drone makes its own decisions based on local information and simple rules.
- 4. COOPERATE**  
 Emergent behavior leads to coordinated swarm actions.

### KEY CHARACTERISTICS

- DECENTRALIZED**  
 No single point of failure. The swarm is robust and resilient.
- SCALABLE**  
 Performance improves as more drones join the swarm.
- ADAPTIVE**  
 The swarm adapts to changes and unexpected situations.
- EFFICIENT**  
 Drones share the workload and optimize energy and resources.

- Communication Link
- Sensor / Observation
- Local Interaction (Neighbor)

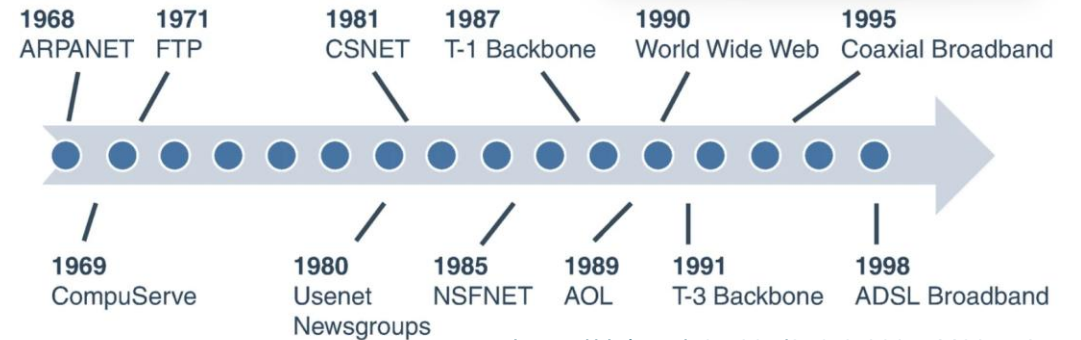

### BENEFITS OF SWARM DRONES

- Robust & Resilient**  
 No single point of failure
- Faster & More Efficient**  
 Parallel execution of tasks
- Cost-Effective**  
 Uses many low-cost drones instead of one expensive asset
- Wide Coverage**  
 Covers large areas quickly
- Flexible & Versatile**  
 Applicable to many industries and missions

### TYPICAL APPLICATIONS

- Security & Surveillance
- Search & Rescue
- Environmental Monitoring
- Infrastructure Inspection
- Precision Agriculture
- Logistics & Delivery

# Dual use: (un)known pattern in IT development?

Timeline of Internet milestones

[https://doi.org/10.1007/978-3-030-14439-5\\_2](https://doi.org/10.1007/978-3-030-14439-5_2)

## Civilian adaptation of capabilities that defence investment has accelerated:

- secure communications
- resilient navigation
- better thermal and multisensor payloads
- weather-hardening
- modular open architectures
- autonomous logistics
- interoperable command-and-control

# European Defence Agency

## UNMANNED AIRCRAFT SYSTEMS

**Unmanned Aircraft Systems (UAS) technology has been rapidly advancing in recent years, having become increasingly popular in both military and civilian applications. UAS can be used for a variety of applications such as intelligence, surveillance, and reconnaissance (ISR), search and rescue (SAR) operations, disaster response, monitoring natural disasters and border patrol.**

EDA funding of UAS: 11 ongoing projects, EUR 15 million

# Drones for European Humanitarian Assistance and Civil Preparedness

A **public-interest infrastructure** in the sky, on the ground, and on the water.

Drones as “**first on scene**” use cases reaching an emergency area before responders, collect early information and report, bring aid equipment, and can warn people about imminent danger or support remote messaging before teams arrive.

# Drones for common good

When governed properly, drones can **reduce time to action**, **reduce risk to responders**, improve **access for remote communities**, and **maintain a thread of communication** when the rest of the system is failing.

Drones are **delivering blood, vaccines, diagnostic samples, defibrillators, nutrition supplies, network infrastructure for communication**. They **collect information** for maps and emergency situational awareness.

# GLOBAL DRONE MARKET — SIZE, SEGMENTS & SUPPLY

**~€73B**

Global market 2024  
total incl. military

**~24%**

EU share of global

**~€164B**

Forecast 2030  
CAGR ~14%

**2.8M**

Commercial units 2024  
connected drones

**~70%**

CN global share of supply  
consumer & commercial

## Market Segments (2030 projection, €B)

## SUPPLY: CHINA'S STRUCTURAL DOMINANCE

## Key demand drivers

 Defence & ISR

 Precision Agriculture

 Infrastructure Inspection

 Logistics & Delivery

 BVLOS & Connectivity

# Future Perspectives - Trends, Risks & Opportunities 2030+

Global market trajectory (\$€)

Key trends shaping demand

## Autonomy & AI

Optionally autonomous systems projected majority of new EU UAV purchases by 2028. Sensor-to-shooter loops shrunk from 20 min → <3 min.

## BVLOS & U-space

Regulatory corridors opening. Delivery drones growing from €0.5B (2022) to €10B+ by 2030.

## Defence surge

EU military drone market: €4.1B (2024) → €25B (2033). Ukraine conflict accelerating design cycles to weeks.

## Counter-drone market

C-UAS growing at 25% CAGR to €20.3B by 2030. EU allocated €30M for joint counter-drone buys 2026–27.

## ▲ OPPORTUNITY

- EU sovereign supply chain investment surge
- EASA framework enabling cross-border commercial operations
- Defence-civil dual-use technology synergies
- Delivery & inspection BVLOS corridors opening

## ▼ RISK

- Structural cost/scale gap vs. Chinese manufacturers
- Critical component dependency (batteries, chips)
- US-style CN ban could disrupt EU operators
- Regulatory fragmentation across member states

## ◆ WATCH

- China supply chain restrictions (Ukraine precedent)
- Swarm & autonomous weaponization governance
- Satellite bandwidth constraints for BVLOS scale
- Privacy & surveillance regulation tightening

# EU policies and legislation on drones: a complex landscape

## FOUNDATION — AVIATION SAFETY FRAMEWORK

- Reg 2018/1139 - Basic Regulation — EASA authority over UAS
- Reg 2019/945 (amend. 2020) - UAS product regulation — design & manufacturing
- Reg 2025/870 - Delegated regulation — latest amendment to 2019/945

## OPERATIONAL RULES — OPEN, SPECIFIC & CERTIFIED CATEGORIES

- Reg 2019/947 (amend. 2020/2021) - UAS operational rules — Open, Specific, Certified
- PDRA / STS (2021 onwards) - Predefined & Standard Risk Assessments
- Reg 2020/639 + 2021/1166 - Amendments to operational rules & class requirements
- EASA Easy Access Rules (Rev. July 2024) - Consolidated operational guidance (UAS)

## HORIZONTAL LEGISLATION WITH DIRECT DRONE RELEVANCE

- GDPR 2016/679 (2018 applicable) - General Data Protection Regulation
- NIS2 Directive 2022/2555 (Oct 2024 transposition) - Network & Information Security Directive 2
- AI Act 2024/1689 (phased to 2027) - EU Artificial Intelligence Act
- CRA 2024/2847 (phased to 2027) - Cyber Resilience Act
- RED 2014/53/EU + delegated acts (2022) - Radio Equipment Directive — drone connectivity
- REACH / RoHS / Battery Reg - Product safety: chemical, materials & batteries

## AIRSPACE INTEGRATION & TRAFFIC MANAGEMENT (U-SPACE)

- Reg 2021/664 - U-space regulatory framework
- Reg 2021/665 - Surveillance & common information services (U-space)
- Reg 2021/666 - Manned aviation access to U-space
- Remote ID (Art. 14, 2019/947) - Remote identification — mandatory from Jan 2024
- Geo-awareness (2019/947 + updates) - Geo-awareness & geofencing requirements

## SECURITY, DEFENCE & COUNTER-DRONE

- COM(2026) 81 - Action Plan on Drone & Counter-Drone Security
- COM(2023) 659 - EU policy on countering drone threats
- EDF 2021–2027 - European Defence Fund — drone & C-UAS grants
- SAFE Reg 2025/1106 - Security Action for Europe regulation
- Drone Strategy 2.0 - EU Drone Strategy 2.0

## FORTHCOMING / PIPELINE (2026–2030)

- Drone Security Package: Updated registration, ID & C-UAS legislation, Exp. end-2026
- C-UAS Reg. framework - EU-level counter-drone regulatory framework, Target 2030
- EASA Cx rework - Revised EASA drone classification system, In progress 2026
- EU Counter-Drone CoE - Counter-Drone Centre of Excellence, Launch target 2027
- Certified Category regs - Regulations for air taxis & human transport UAS, Expected 2026–2027

# Future Outlook: Challenges & Opportunities Ahead (1)

## THE TECHNOLOGICAL HORIZON

### Cyber-Physical Convergence

Drones exist simultaneously as physical objects, digital twins, and data sources. What we learn to govern here sets the template for every autonomous system that follows.

### Simulated Worlds as Policy Tools

Digital twins let us run a drone corridor a thousand times before it opens. Powerful — but simulated environments can also be manipulated to justify decisions already made.

### Sovereignty Across the Full Stack

Europe's challenge is not proving drones are useful. It is building sovereign capabilities at every layer: chips, software, connectivity, AI, orchestration.

### Convergence Opportunity

Drones, autonomous vehicles, and robots share the same stack. Investment in one benefits all three — the case for European sovereign autonomous systems is economy-wide.

## THE GOVERNANCE IMPERATIVE

### Regulation as Differentiator

AI Act, NIS2, U-space, GDPR — used correctly, Europe's framework is not a burden. It is the only jurisdiction offering trustworthy, human-oversight-compliant autonomous systems.

### Governance of New Airspace

How do you manage airspace that is simultaneously a public good, a commercial infrastructure, and a security asset? New governance models — not yet invented — are needed.

### Social Legitimacy

Drones over homes and schools will face resistance unless communities are engaged and oversight is credible. Social acceptance is a governance design problem, not a communications problem.

*Technology acceptance is not automatic — social legitimacy and sovereign capability must be built in parallel with the engineering.*

# Future Outlook: challenges & opportunities ahead (2)

- Gap between the new technical capabilities and the operational practices
- Legal and organisational obstacles
- Supply chain dependency and resource consumption
- Costs are underestimated
- Shared physical space (safety, privacy, liability)
- Illusion of super-power and new dependencies
- Erosion of jobs and skills

How can we integrate autonomous drones in our physical environment in a good way?  
What world do we wish for?
