... the **workshop** challenge ...

*All complex socio-technical software systems
are embedded in the world*

and

*must therefore take into account various
digital humanism **values** and **issues**.*

*... the **workshop** challenge ...*

How?

By drawing on your multiple perspectives and embracing an interdisciplinary approach ...

to consider a spectrum of human and technical issues that account for political, economic, environmental, and social values and concerns.

*... the **project** challenge ...*

The main aim of the project sessions is to encourage you to engage with the challenges of

*eliciting,
articulating,
and organising*

the various digital humanism issues that are presented in the workshop,

*as system **goals**.*

Goals ?

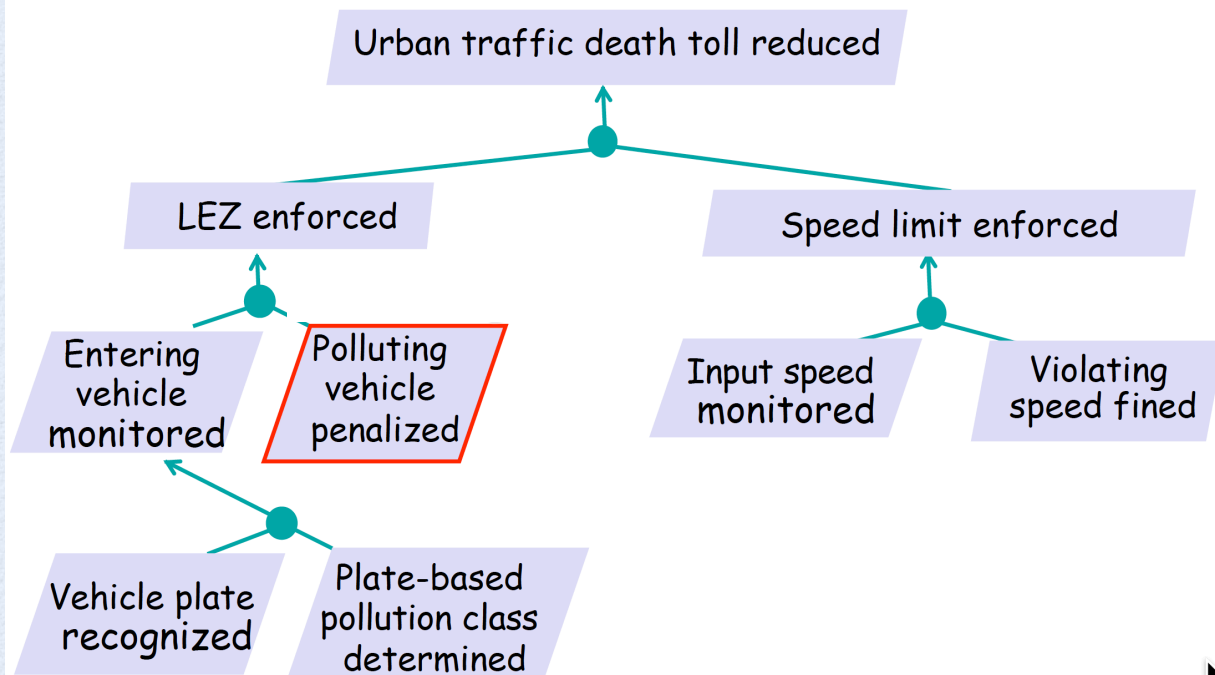

Goals can be used to justify and describe the requirements that a system is expected to

*achieve,
avoid,
maintain
or*

satisfy to some acceptable degree.

Goal hierarchy

Low Emission Zones (LEZ): high-level goals

Hard and Soft Goals

Soft goals achievement cannot be established in a clear cut sense.

Goal satisficing

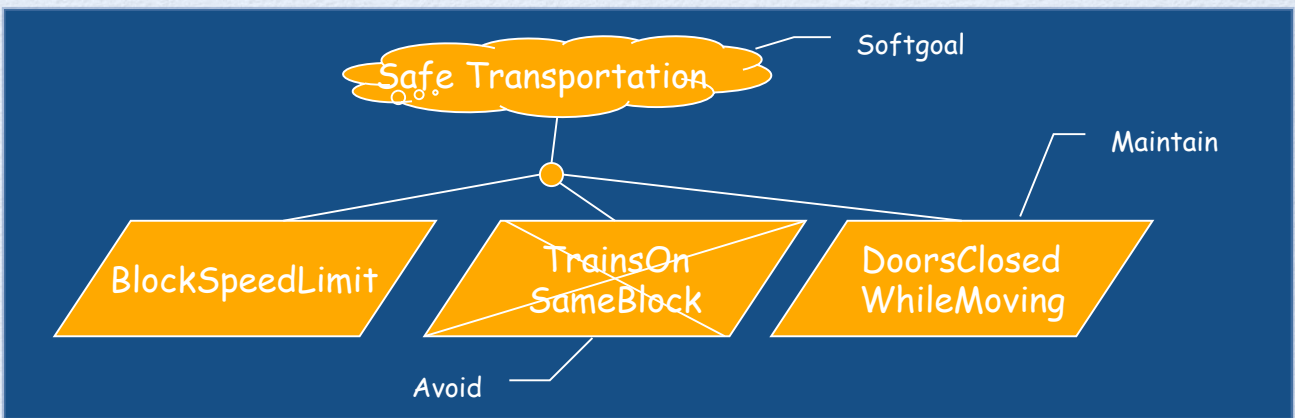

Qualitative reasoning

Hard goals (achieve/maintain) can be verified

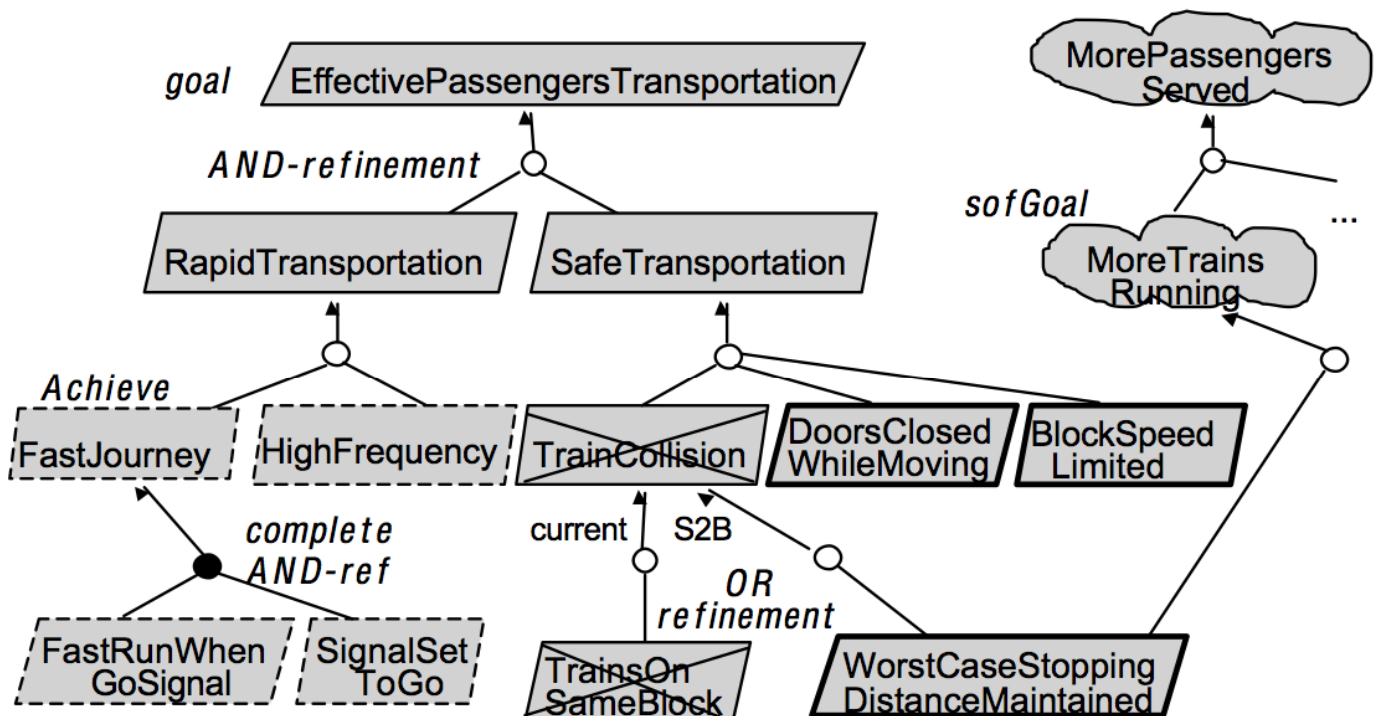

Goal satisfaction

Formal reasoning (possibly quantitative)

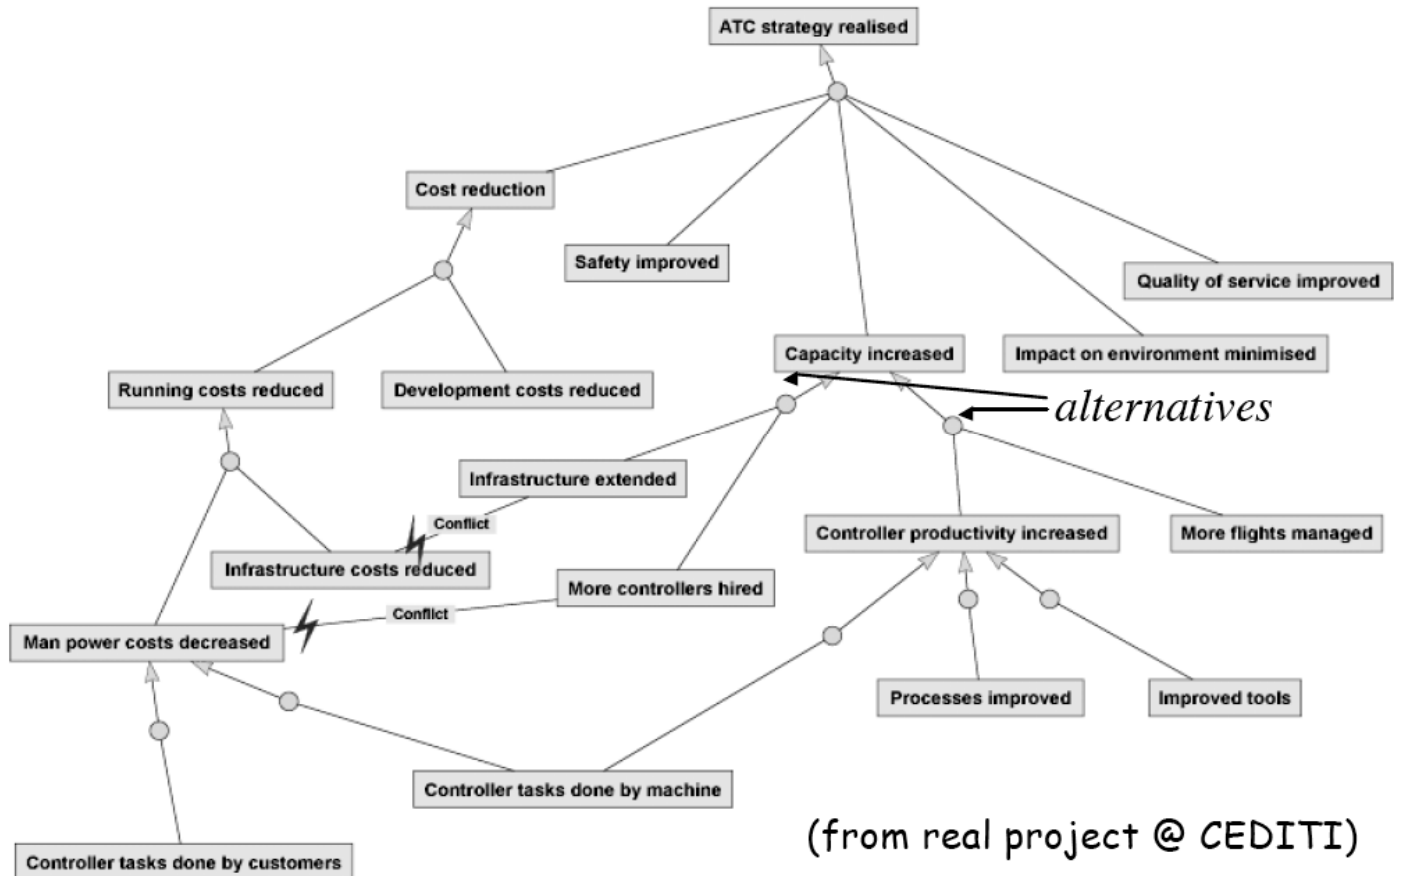

Relation to Functional/Non-functional

Goal refinement: AND, OR

Goals - conflicts

... the **project** challenge ...

Participants might also elaborate on the features that systems should support to achieve or maintain their goals,

and consider

*how it would be possible to ascertain whether an existing system is **compliant** with what was initially expected.*

... the **project** challenge : summary...

Experiment with the value of putting together students with different backgrounds (not just computing) in articulating the DigHum goals and overall requirements to be reached by a hypothetical socio-technical system, understanding potential conflicts and mitigating potential risks. In doing so, reflect on what the lectures teach you about DigHUM values.

Hypothesis is that we need inputs and insights that are not purely technical, but also cover social/political/anthropological aspects in the conception phase, to anticipate how systems can be used/misused. Consideration on what should be automated and what should be left to humans is part of the discussion.

... Monday Discussion ...

- *Why do we engage you in a project?*
- *How is the project related to the other topics ?*
- *How is the project activity structured?*
- *Some tools to organize your work.*
- *Interdisciplinary group formation*
- *Sessions:*
 1. Monday
 2. Thursday
 3. Friday
